                    Retinoid metabolising protein; P450RAI; retinoid oxidase; retinoic acid; zebrafish; inhibitor; antibody; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the amino acid for cytochrome zP450RAI of the zebra fish. Its expression is dependent on the presence of retinotc acid (RA). The retinoid-regulated genes such as the inducible cytochrome P450RAI gene specifically metabolises a derivative of the RA. The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA.

                                                                                                                                                                                                                                                                                           Qy
                                                                                                                                                                                                                                                                                                                                                                                                   This protein comprises a novel zebrafish retinoid metabolising protein, designated zp450RAI. Its amino acid sequence was deduced from a CDNA clone (see AAVI2203) isolated from a 6-18 hr embryo library. It includes a haem-binding motif characteristic of cytochrome p450 proteins. zp450RAI is a retinoid oxidase that has the ability to hydroxylate retinoic acid at the 4 position of the beta-ionone ring, and is inducible in epithelial cells exposed to retinoic acid. Zebrafish, human and mouse p450RAIs (see AAW44159-61) are claimed. They can be expressed in host cells and used to metabolize retinoic acid in an organism or cell, in drug screening, and to raise antibodies useful for inhibiting retinoic acid hydroxylation for the treatment of cancer, actinic keratosis, oral leukoplakia, secondary tumours of the head and/or neck, non-small cell lung carcinomas, basal cell carcinomas, acute promyelocytic leukaemia, skin cancer, and premalignancy associated with actinic cell lung carcinomas, and/or ichthocsis.

                                                                      This is the amino acid sequence of the human cytochrome P450RAI. Its expression is dependent on the presence of retinoic acid (RA). The retinoid-regulated genes such as the inducible cytochrome P450RAI gene specifically metabolises a derivative of the RA. The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA.
                                                                                                                                                                                                           Identifying DNA encoding inducible or suppressible cytochrome P450 by screening for drugs which reduce the catabolism of retinoic acid useful in cancer chemotherapy and the treatment of acne and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          designated hp450RAI. Its amino acid sequence was deduced from a cDNA clone (see AAV12204) isolated from a retinoic acid-treated NT2 cDNA clone (see AAV12204) isolated from a retinoic acid-treated NT2 cell library. It includes a haem-binding motif characteristic of cytochrome P450 proteins. hp450RAI is a retinoid oxidase that has the ability to hydroxylate retinoic acid at the 4 position of the beta-ionone ring, and is inducible in epithelial cells exposed to retinoic acid. Zebrafish, human and mouse P450RAIs (see AAW4159-61) are claimed. They can be expressed in host cells and used to metabolize retinoic acid in an organism or cell, in drug screening, and to raise antibodies useful for inhibiting retinoic acid hydroxylation for the treatment of cancer, actinic keratosis, oral leukoplakia, secondary tumours of the head and/or neck, non-small cell loung carcinomas, basal cell carcinomas, acute promyelocytic leukaemia, skin cancer, and premalignancy associated with actinic keratosis, acne, psoriasis and/or ichthyosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

```

This amino acid sequence is of an isoform of cytochrome zP450RAI. Its expression is dependent on the presence of retinoic acid (RA). The retinoid-regulated genes such as the inducible cytochrome P450RII gene specifically metabolises a derivative of the RA. The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                      designated mp450RAI. Its amino acid sequence was deduced from a colona clone (see AAV12205) isolated from a retinoic acid-treated p19 teratocarcinoma library. It includes a haem-binding motif characteristic of cytochrome P450 proteins. mp450RAI is a retinoid coxidase that has the ability to hydroxylate retinoic acid at the 4 position of the beta-ionone ring, and is inducible in epithelial cells exposed to retinoic acid. Zebrafish, human and mouse P450RAIs (see AAW44159-61) are claimed. They can be expressed in host cells and used to metabolize retinoic acid in an organism or cell, in drug screening, and to raise antibodies useful for inhibiting retinoic acid hydroxylation for the treatment of cancer, actinic keratosis, coral leukoplakia, secondary tumours of the head and/or neck, non-small cell lung carcinomas, basal cell carcinomas, acute with activic because a secondary tumours of the head and/or associated with a coral carcinomas, skin cancer, and premalignancy associated

The present sequence is Arabidopsis thaliana cytochrome P450 type hydroxylase. The hydroxylase can be used to identify brassinosteroids or brassinosteroid inhibitors, useful to produce plants with modified physiological and/or phenotypic characteristics. The modified plants may show, e.g. stimulation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               accelerated seed germination at low temperatures, an increase in dry weight, repressed anthocyanin production during growth in light and/or inhibited de-eticlation which is induced, e.g. by cytokinin, in the dark or an increase in stress tolerance. The hydroxylase or its coding sequence can also be used for the recombinant production of compounds, e.g. teasterone.

The polypeptide is exptochrome P450 enzyme that mediates multiple steps in synthesis of brassinosteroids. Specifically, it mediates multiple 22alpha-hydroxylation steps in brassinosteroid biosynthesis. The DWF4 polynucleotide is used for altering the phenotype of a plant. DWF4 polynucleotide a dramatic reduction in the length of different organs, and this size reduction is attributable to a defect in cell elongation. The DWF4 polynucleotides and polypeptides can be used in diagnostic assays and to generate antibodies, which can be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated \text{dw} f4 polynucleotide useful for altering the phenotype of plants, for diagnostic assays and in the production of antibodies –
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2000-549142/50.
